

ADDING VALUE

with BERHALTER die-cutting

Just in time for “interpack 2014” (hall 11, booth C76), BERHALTER is introducing another world-first. The company will be exhibiting the latest generation BERHALTER high-performance die-cutting machine in connection with the latest laser technology PRElaser™, which can result in performance and efficiency increases of up to 35%.

Die-cutting with laser technology

The BERHALTER PRElaser™ laser technology can be used for various areas of application. One of the target markets is the so-called multipack yoghurt lids, which can now be pre-perforated using the BERHALTER PRElaser™ so that the yoghurt pots can be individually snapped off and separated without the lid being unintentionally removed

Over the last few years, BERHALTER has reacted continuously and highly flexibly to increased market demands and has introduced a number of innovations to the market.

Alongside its capacity for constant innovation, BERHALTER is synonymous with the production of efficient and customer-oriented die-cutting systems.

We specialise in the manufacturing of user-friendly but high productive die-cutting machines. All innovations can be added with equal ease to BERHALTER standard machines to create individual die-cutting solutions. As the world's only manufacturer of flat-bed die-cutting systems with our own tool-making department, we are a reliable partner to our customers for the complete die-cutting process.

At the start of countless packaging processes

BERHALTER die-cutting systems are the most high-performance solution for efficient and accurate punching of foils and films from rolls. Across the world, BERHALTER die-cutting machines are at the start of numerous packaging solutions, fulfilling all customer requirements.

This applies for flat packaging lids out of aluminium or polyester, such as Nestlé yoghurt lids, as well as for packaging lids with relief impressions, like Philadelphia lids for cheese spread. Deep-drawn aluminium lids as those used for PET food like Sheba or Cesar enhances the extensive range of product opportunities. But BERHALTER die-cutting machines can also be used to produce paper labels, e.g. on beer bottles and labels for IML applications, such as those on Starbucks coffee cups.

We will continue to improve efficiency and to focus consistently on the success markets of our customers.
