

Find out the advantages of the preferential heating

Manufacturers of **detergents, cleaners, cosmetics, sauces and condiments** are more likely to use **non-cylindrical containers**, that are practical to handle and widely customizable in terms of shape, size and look.

Getting **high-quality non-cylindrical PET containers** requires the use of blow moulding technologies of the latest generation, that ensure the **uniform distribution of material** over the whole surface of the container, in order to improve the efficiency of the production process and realize resistant and aesthetically perfect containers.

In a **stretch-blow moulding plant** it is thus necessary to asymmetrically heat the preforms through a **differentiated heating system** in order to obtain rectangular and oval containers with **uniform thickness** on all sides.

DISCOVER THE SMI PREFERENTIAL HEATING

Uniform thickness on all
container sides

No areas with
improperly stretched
material

Optimized weight for
containers with complex
shapes

Easier and appealing
labelling
