

## Overhead lifting equipment for loading a lathe

Indeva, model Liftronic EASY E80R, overhead mounted manipulator complete with gripping tool by vacuum for **lifting long steel tubes and releasing them into a lathe.**

An Indeva is the most productive and efficient way for loading a lathe with heavy tubes because, thanks to its auto balancing feature, the operator can lift tubes with different weights without stopping for selecting the presetting relative to the load weight is lifting.

The INDEVA manipulator reacts in real time with no inertia forces when reversing load direction, saving your operators from the damaging physical strain these direction changes can have on their bodies. Lifting operations with an INDEVA are really ergonomic and effortless for the operator.

For the above mentioned reasons the **INDEVA are the lifting systems that Safety & Ergonomics Managers advise.**
